This reference describes a method to loosen the ground to increase the permeability of the ground. In this regard, several pipes are used which are arranged around the well. After sealing the well, pressurized water or air is supplied through the pipes to the ground. After starting the pump of the well, the ground is loosened up and supplied to the well.

**DE 919 520**

This reference describes a well with a pipe 20 which has a slot 21. The size of the slot is such that during normal production, gravel is not falling through the slot. In the case of regeneration, when water is supplied through the pipe 9, a certain amount of gravel will fall through the slot.
